

ABSTRACT OF THE DISCLOSURE

A bow stand attachment for an archery bow has a base which mounts to the riser of the bow. The base has a pair of legs extending downward from it. The legs are slid onto stubs which extend away and downward from the outer rim of the base. The ends of the legs and the end of a stabilizer mounted to the bow can cooperate to provide a supporting tripod for the bow. When no stabilizer is attached to the bow, the bow stand and lower pulley act as a tripod to support the bow. Performance of the bow is not affected by presence of the attachment because of its low mass and symmetry on the riser of the bow.
